Battery backup system at start-up

This appliance is equipped with a battery back up system.
Please activate the battery backup before final placement (see fig. 2)

fig. 2

Use a pen or screwdriver to push the button through the above hole on the appliance backside. This will switch on the battery backup system.

Then please check the battery backup image  appears in the front display lower left corner. This shows the battery backup is activated.

NOTE!

The battery backup system does not supply the cooling system with power.

When starting up the appliance for the first time it is necessary to switch on the battery backup system.

NOTE!

The battery for back up should be changed every third year to secure 50 hours of back up. Please put this change in the maintenance schedule for every third year.

Battery backup function

The battery backup system supplies the controller and keyboard with power at power failure. This makes it possible to supervise the temperatures in the unit during the power failure. The battery backup system makes it possible to supervise the temperatures for 50 hours. After a power failure and at the first start up the battery needs to be recharged. To regain the full capacity the battery will be reloading for 10 days

Reversing the door

1. For a hingeside change turn off main power and place the appliance on a table. Protect top from scratches.

2. Loosen and remove visible top screws (use 3 mm allen key + Torx 20 tool)

3. Open the door to gain access.

4. Remove three screws underneath the toppanel (use 3 mm allen key)

5. Remove lock pin (use 4 mm allen key)

6. Carefully pull out the toppanel...

7. ...and place it upside down on the cabinet top

8. Loosen 2*M8 screws approx. 5 mm (use 5 mm allen key)

9. Loosen pivot nut (use 10 mm spanner)

10. Lift up the top bracket/pivot. Pull out the door and lift it off the bottom pivot

11. Loosen door top pivot (use 2,5 mm allen key if necessary)

12. Remount pivot in the new hinge side

13. Tighten pivot (2,5 mm allen key)

14. Tighten pivot nut

15. Demount fix nut and top handlelock pin

16. Remount the top handlelock pin in the opposite side. Tighten the fix nut again

17. Go to bottom and remove the door pivot nylon washer

18. Remove the two front feet

19. Remove bottom handlelock pin plate by loosening two screws (use 4 mm allen key)

20. Loosen bottom pivot nut

21. Loosen door bottom pivot

22. Remount door pivot for use in new hinge side

23. Tighten pivot

24. Remount and tighten pivot nut

25. Loosen the bottom door bracket screws in one side (use 4 mm allen key)

26. Loosen the screws in the opposite side and rotate the bottom door bracket

27. Then remount and tighten the screws in both sides

28. Re-position the door pivot nylon washer

29. Remount bottom handle lockpin plate in the opposite side by tightening the two screws again (use 4 mm allen key)

30. Remount and tighten the two front feet

31. Go to the current door bottom and demount two screws from the door closer (use Torx 20 tool)

32. Remove the door closer and keep it ready for mounting in the "new" door bottom

33. Remount the two screws without the door closer

34. Rotate the door

35. Unscrew the two doorcloser screws in this new door bottom end (use Torx 20 tool)

36. Place the doorcloser in the empty threadholes

37. Remount the two screws and the door-closer is fixed

38. Re-locate the door on the cabinet in the new hingeside

39. Tighten the two M8 screws in the top bracket

40. Carefully push the toppanel back into position

41. Remount the three screws upwards in the toppanel...

42....and remember the screw close to the top door pivot is mounted in hole nr.2 inwards, to ensure sufficient space between the screw and the door end-cap during mounting

43. Remount the lock pin

44. Remount the four topscrews

45. The door re-hinging operation is now complete

Controller. Operation and function

User interface

LEDS

Each LED function is described in the following table.

| LED | MODE | Function |
|-------|----------|-------------------------------------|
| | ON | Compressor enabled |
| | Flashing | Anti-short cycle delay enabled |
| | ON | An alarm is occurring |
| | ON | Recording activated |
| | ON | Battery is fully charged |
| | Flashing | Battery is being charged |
| | Flashing | Charging problem or battery failure |
| °C/°F | ON | Measurement unit |
| °C/°F | Flashing | Programming phase |

Buttons

| | |
|---|--|
| SET | To display target set point; in programming mode it selects a parameter or confirm an operation. |
|  | To enter fast access menu In programming mode it browses the parameter codes or increases the displayed value. (DOWN); n programming mode |
|  | In programming mode it browses the parameter codes or decreases the displayed value. Push it for 3s to start a manual defrost |
| DATA | Export data from button |
|  | Not used |
| REC | Log activation and deactivation from button (Password protected) |

How to see and change the setpoint

How to: See the Set point

1. Push and immediately release the SET key: the display will show the Set point value.
2. Push and immediately release the SET key or wait for 60 sec to display the temperature in the unit

How to: Change the Set point

1. Push the SET key more than 2 sec to change the Set point value.
2. The value of the set point will be displayed and the “°C” LED will start blinking.
3. To change the Set value push the UP or DOWN arrows within 60 sec.
4. To save the new set point value, push the SET key again and wait for 3 sec.

NOTE: To exit without making any change to the set point, push the SET key or wait 60 sec.

Clock settings and RTC alarm reset

1. Push the UP key once, to access the menu.
2. The display shows H0, then push SET.
3. The parameters for setting time and date occurs. To set the parameter push SET, push the UP or DOWN button to change the parameter. Confirm by pushing SET.

The time and date parameters:

Hur: hour

0in: minutes

Udy: weekday

dAy: date

0on: month

yEA: year

To exit: Press **SET + UP** keys for about 10 sec. or wait 60 sec.

How to export data and alarms to USB

1. Insert the **USB** key
2. Push the **DATA** key for more than 3 sec.
3. Controller starts uploading data to **USB**
4. At the end the following message will be displayed:
 - a. "End" if everything is ok
 - b. "Err" if exporting has not taken place.

Alarms

The controller memorizes the last 100 alarms happened, together with their start and finish time. It's possible to export the alarms as described in the previous chapter.

Active alarm

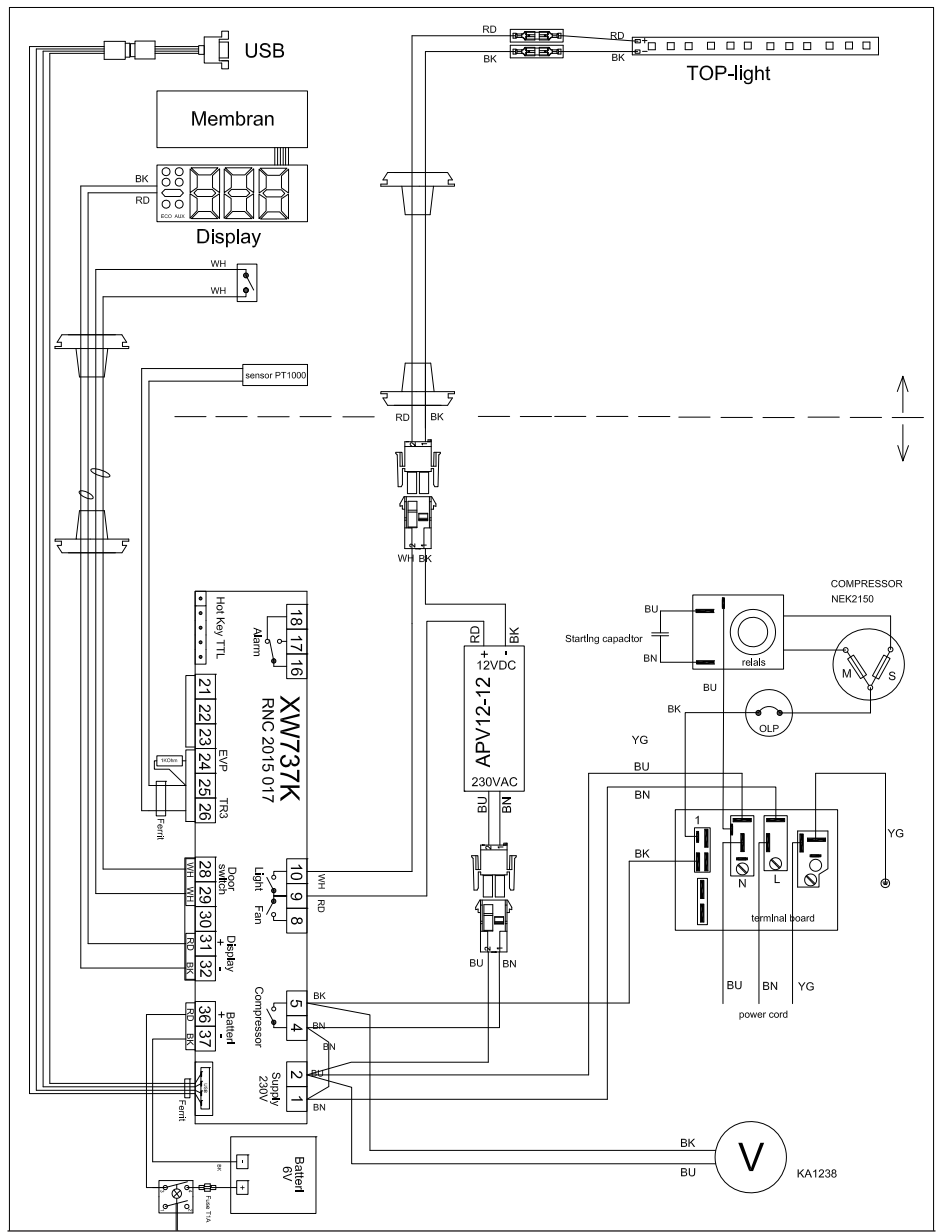

Controller will show active alarm alternated with the temperature inside the unit.

Alarm signals

| Message | Cause |
|---------|------------------------------|
| "P1" | Regulating probe TR3 failure |
| "HA1" | TR3 High Alarm |
| "LA1" | TR3 Low Alarm |
| "EA" | Door Open Alarm |
| "CA" | Serious Alarm |

The alarm message is displayed until the alarm condition is recovered.
All the alarm messages are shown alternating with the temperature in the unit.
Except for the "P1" which is flashing.

Wire diagram

List of parameters

| Group | Parameter | Description | Edit | Original | Vis. | Level | Minimum | Maximum | Unit | Comment | Active |
|-----------------------------|-----------|--|-------|----------|------|-------|---------|---------|------|---------|--------|

VTS 098

Recharging refrigerant from a service bottle

The recharging shall take place in a room where the ambient temperature is between 20 and 25 C.

1. The service bottle shall have ambient temperature, i.e. between 20 and 25°C.
2. The service bottle is turned upside down as shown in the picture.
3. If you have the possibility to measure the weight of the bottle before you start recharging, it is useful to determine when the charge is sufficiently.
4. The system of the VTS098 shall be evacuated thoroughly.
5. Connect the bottle to the system.
6. The valve shall only be opened a little (please see the 2 blue lines (A and B) on the valve wheel on the picture. At line **A**, the valve is closed and then just turn it to line **B**.
7. Let the valve be opened for 5 minutes, then open it fully and after ½ a minute closed it again.
8. Start the compressor and let it run for 10 minutes.
9. Check that the bottle, especially the valve on the bottle has ambient temperature. If the temperature is too cold after 10 minutes, then stop the compressor.
10. When the valve has reached the ambient temperature, then start the compressor and let it run for 1-2 minutes. Then open the valve slowly up to full open and then close it slowly again.
11. Stop the compressor. Waite until the valve on the bottle again has the ambient temperature.
12. Repeat 10 again. I.e. Start the compressor for 1-2 minutes. Then open the valve slowly up to full open and then close it slowly again.
13. Now the system normally is recharged. If you have the possibility to weigh the bottle, then the charge is ok if you have charged minimum 110 grams into the system.
14. If you have charged less than 110 grams, then repeat 10 once more.

Notice. If you start the compressor at point 8 with the valve open then you can ruin the compressor.

Reserving the right to alter specifications without prior notice.
